spi_master: Simulation Result

PHASE	TEST	STATUS
Phase 1	**spi_master**	**PASS**

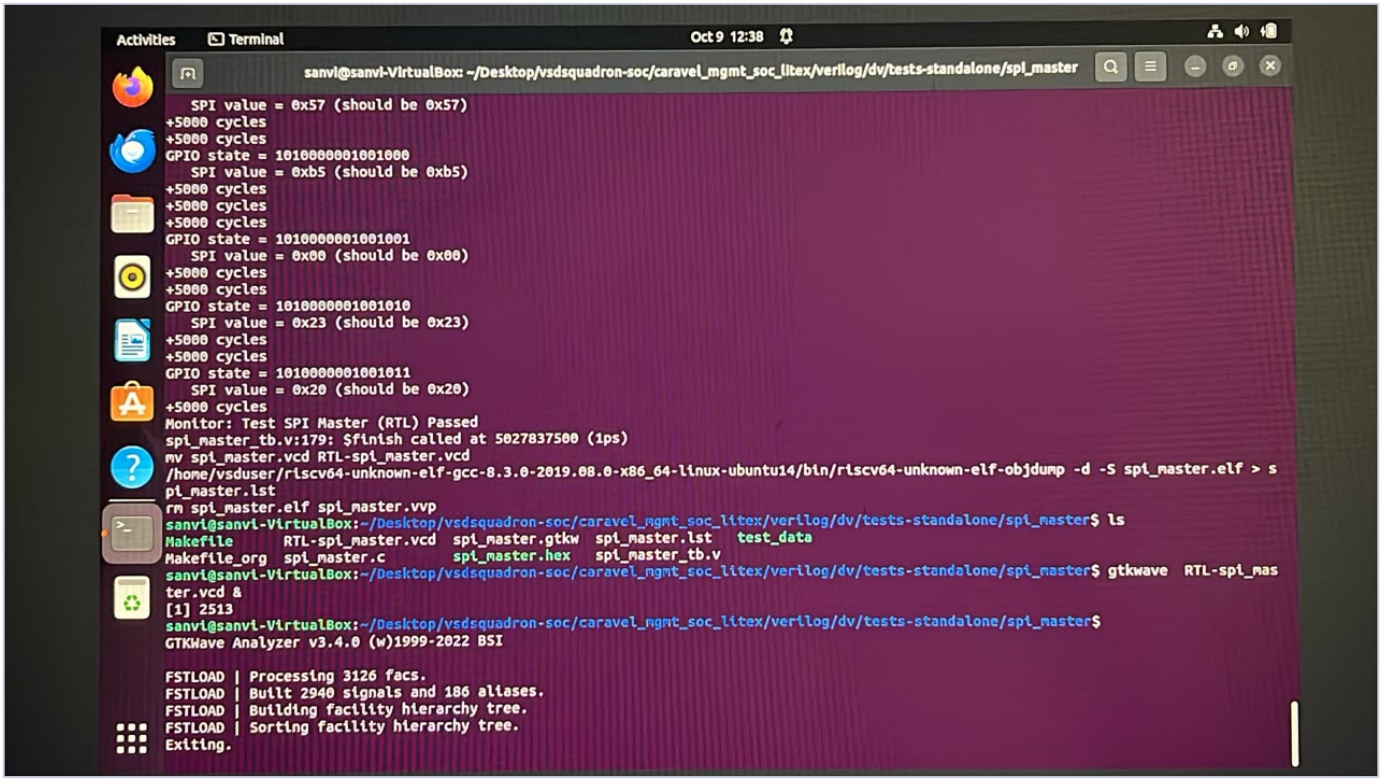

Figure 1. Terminal output of make clean; make in tests-standalone/spi_master

What this shows

- The testbench prints each SPI value read back next to the expected value (for example `0x57 (should be 0x57)`).
- Final verdict line: `Monitor: Test SPI Master (RTL) Passed`.
- The simulation ended at 5,027,837,500 ps (about 5.03 ms) from `spi_master_tb.v` line 179.
- The Makefile then renamed the waveform to `RTL-spi_master.vcd` and removed the temporary files.

> **Conclusion.** Every value matched its expected value, so spi_master passes.
