uart: Simulation Result

PHASE	TEST	STATUS
Phase 2	uart	PASS

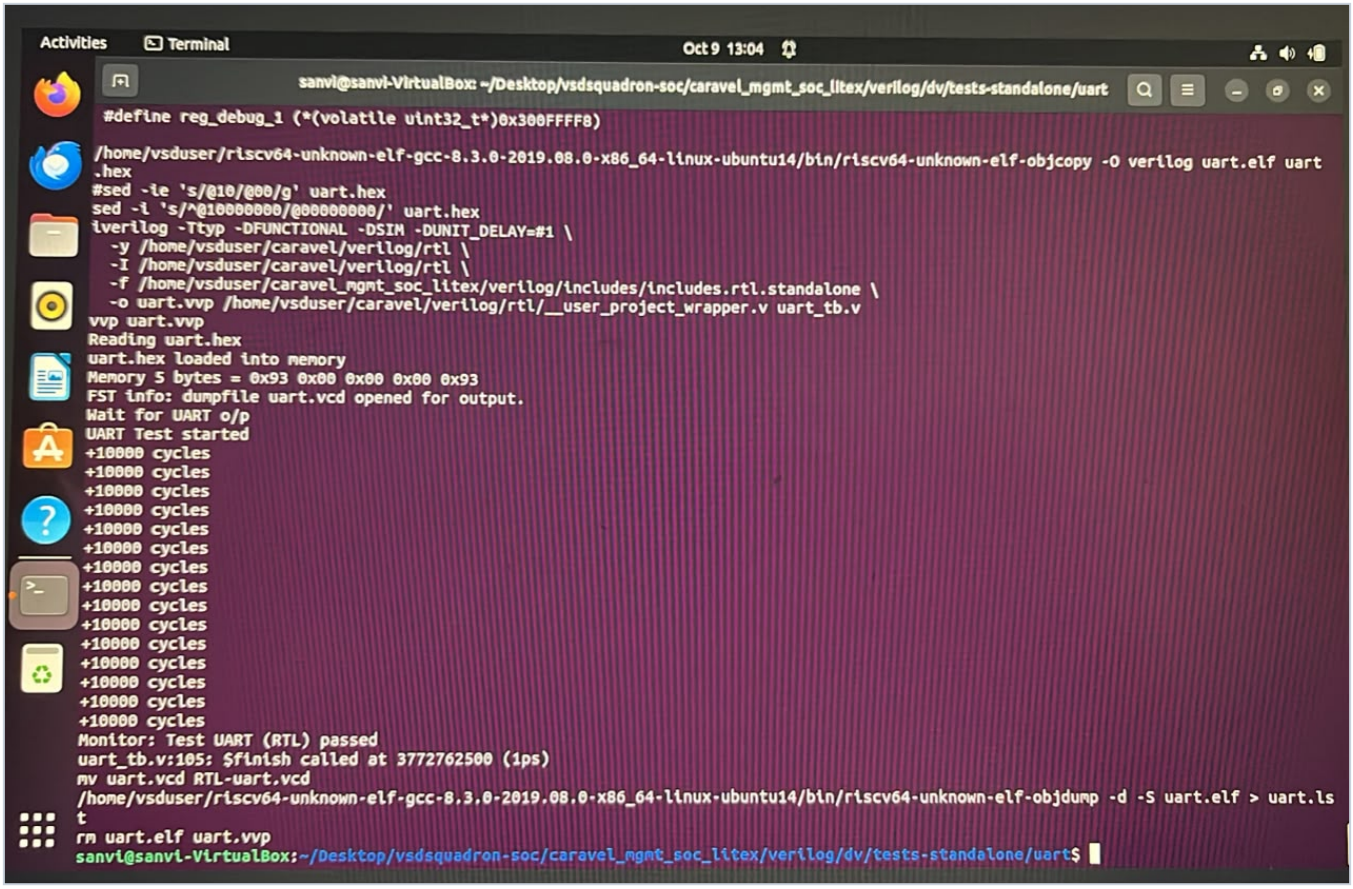

Figure 5. Terminal output of make clean; make in tests-standalone/uart

What this shows

- The output shows the whole make flow in order: `objcopy` and `sed` (firmware hex), `iverilog` (compile), `vvp` (simulate).
- `uart.hex loaded into memory` and `UART Test started` mark the start of the test.
- Final verdict line: `Monitor: Test UART (RTL) passed`. The simulation ended at 3,772,762,500 ps (about 3.77 ms).
- The compiler warnings about `reg_debug_1/2` being redefined do not stop the build.

Conclusion. The firmware sent its message over UART and the testbench received the expected data.
